

Applying ML/Deep Learning Techniques to Gamma Ray Astronomy

Krishiv Bhatia

Update: 12/08/2023

Update on Progress

- Refreshed Jerry's YouTube presentation
- Downloaded the 4FGL-DR4 FITS file from https://fermi.gsfc.nasa.gov/ssc/data/access/lat/14yr_catalog/
- Installed the TOPCAT tool on my laptop
- Viewed the 4FGL-DR4 FITS file from TOPCAT.

The screenshot shows the TOPCAT(2): Table Browser window. On the left, a 'Table List' sidebar shows several FITS files, with 'gll_psc_v33.fit-2' selected. The main panel displays a table titled 'Table Browser for 2: gll_psc_v33.fit-2'. The table has columns for Source_Name, RAJ2000, DEJ2000, GLON, GLAT, Model_Form, and M. It lists 18 sources, including SMC-Galaxy, 3C 58, HB 3, W 3, Fornax A, G150.3+4.5, HB 9, LMC-FarWest, LMC-Galaxy, LMC-30DorWest, LMC-North, Crab IC, S 147, IC 443, Rosette, Monoceros, Puppis A, and Vela X. At the bottom, it shows 'Total: 82', 'Visible: 82', and 'Selected: 0'.

	Source_Name	RAJ2000	DEJ2000	GLON	GLAT	Model_Form	M
1	SMC-Galaxy	14.5	-72.75	302.25	-44.37	Map	
2	3C 58	31.404	64.828	130.718	3.084	2D Gaussian	
3	HB 3	35.36	62.69	133.05	1.6	Disk	
4	W 3	35.62	61.94	133.42	0.94	Map	
5	Fornax A	50.67	-37.21	240.17	-56.69	Map	
6	G150.3+4.5	66.425	55.371	150.22	4.29	2D Gaussian	
7	HB 9	75.08	46.66	160.37	2.69	Map	
8	LMC-FarWest	75.25	-69.75	281.	-34.79	Map	
9	LMC-Galaxy	80.	-68.75	279.36	-33.39	Map	
10	LMC-30DorWest	82.5	-69.	279.47	-32.46	Map	
11	LMC-North	82.97	-66.65	276.68	-32.59	Map	
12	Crab IC	83.633	22.02	184.55	-5.78	2D Gaussian	
13	S 147	85.1	27.94	180.25	-1.5	Map	
14	IC 443	94.31	22.58	189.048	3.033	2D Gaussian

18	Vela X	128.6	-45.7	263.873	-3.233	Map	

Update on Progress

- Downloaded ATNF Pulsar Catalogue tar gz file. Followed README to produce the executable psrcat file.
- Followed README
- Psrcat -h works but I get error in the db_file command
- What is this for? How to fix error?

```
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar % ls
README          evalwrap.c      libpsrcat.a     psrcat.db
defineParams.c  evalwrap.o      makeit          psrcat.h
defineParams.o  externalCall.c  myrefs.bbl     psrcat_ref
displayOutput.c externalCall.o   parseParameters.c readCatalogue.c
displayOutput.o galcoord_ecliptic.c parseParameters.o readCatalogue.o
evaldefs.h      galcoord_ecliptic.o plotParams.c    wc_strncmp.c
evalkern.c      galcoord_ecliptic.o plotParams.o    wc_strncmp.h
evalkern.h      galcoord_ecliptic.o psrcat          wc_strncmp.o
evalkern.o      glitch.db       psrcat.c
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar % psrcat -h
-all          Merge with $PSRCAT_RUNDIR/obs*.db
-allref       Lists the entire bibliographic reference file
-bib           Provide bibliographic reference
-bibliography  Lists references within the catalogue
-c            List of parameters to obtain from the database
-check        Checks the catalogue for incorrect entries
-db_file      Database path and name
-descend      Sort in descending order
-e            Produce short ephemeris files suitable for TEMPO
-e2           Produce long ephemeris files
-e3           Produce ephemeris file with selected parameters
-exactMatch   Require exact match for string comparisons
-h            This help information
-l            Logical string for filtering unwanted pulsars
              e.g. p0 > 5
-listref      Provide bibliographic references at end of table
-merge        Merges multiple catalogue files. For example
              -merge "mycat*.db" will merge the public catalogue
              with all the catalogues with filenames mycat*.db in the
              local directory.
-nohead       Do not print a header at the top of the table
-nonumber     Do not print line numbers in output
-nocand       Do not include pulsar candidates
-nointerim    Do not include interim solutions
-null        Null string for displaying for unknown parameter
```

```
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar % psrcat -db_file ./psrcat.db -c "name p0 dm" -l "p0 > 3"
zsh: illegal hardware instruction psrcat -db_file ./psrcat.db -c "name p0 dm" -l "p0 > 3"
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar %
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar % psrcat -db_file ./psrcat.db
zsh: illegal hardware instruction psrcat -db_file ./psrcat.db
rbhatia@Rajeshs-MacBook-Pro-Display psrcat_tar %
```

Next Steps

- Could I have access to the Python scripts that you used with the 3FGL catalog
- Then, if I understand correctly, I need to reproduce your results using PyTorch?
- And then convert to using Neural Networks for Deep Learning?

Update: 01/08/2024

Progress

- 3FGLReproductionBasicLR Python code pointed to 3FGL Catalog file gll_psc_v16.fit.
- Updated it to point to 4FGL catalog file gll_psc_v33.fit.
- Tested with updated feature name
- Modified it for 1 hidden layer NN and DNN (2 hidden layers NN)

Results

Model	AGN Sensitivity	PSR Sensitivity	Accuracy of Best P Fit
Basic LR (0 hidden layer NN)	0.9724137931034482	1.0	0.9733333333333334
Neural Network (1 hidden layer)	0.9620689655172414	1.0	0.9633333333333334
Deep Neural Network (2 hidden layers)	0.9724137931034482	1.0	0.9733333333333334

Features Used

- Used the following features from columns in 4FGL catalog file gll_psc_v33.fit
 - ["PL_Index", "LP_Index", "PLEC_IndexS", "Variability_Index", "Unc_PL_Flux_Density", "Unc_LP_Flux_Density", "Unc_Energy_Flux100", "Unc_PLEC_Flux_Density", "Unc_Flux1000", "LP_beta", "Frac_Variability", "LP_SigCurv", "Signif_Avg"]
 - Found the corresponding 3FGL columns in the 4FGL list
 - Did some trial and error for other columns and checked model performance
- Column list is in pages 32-33 of Abdollahi_2020_ApJS_247_33 paper

Columns

- Printed out from code

1 DataRelease	21 PL_Flux_Density	41 Unc_PLEC_Exp_Index	61 ASSOC_4FGL

Other Changes & Github

Classes

- Separated the large code into classes for code modularity, improvement
- Created separate classes for:
 - **Driver:** 3FGLReproductionBasicLR_v1.py, 4FGLReproductionBasic{LR, NN, DNN}.py,
 - **Feature transformation:** FGL3Dataset.py / FGL4Dataset.py
 - **Models:** LogisticRegression.py, NeuralNetwork.py, DeepNeuralNetwork.py
 - **Utility functions:** utils.py (e.g. run_iteration)

- 3FGLReproductionBasicLR_v1.py
 - FGL3Dataset.py
 - LogisticRegression.py
 - utils.py

- 4FGLReproductionBasicLR.py
 - FGL4Dataset.py
 - LogisticRegression.py

Questions

- Hardness ratios of LAT energy bands
 - 3FGL Catalog had many bands:
 - "Flux100_300", "Flux300_1000", "Flux1000_3000", "Flux3000_10000", "Flux10000_100000"
 - 4FGL Catalog has only one energy band column present:
 - Energy_Flux100
 - From Abdollahi 2020, definition: *Energy flux from 100MeV to 100GeV obtained by spectral fitting*
 - Where do we get other bands to calculate hardness ratios?

Next Steps

- Random Forest & Decision Tree implementations
 - Found Random Forest & Decision Tree implementations using PyTorch
 - <https://discuss.pytorch.org/t/how-can-i-use-knn-random-forest-models-in-pytorch/42464/2>
 - https://github.com/ValentinFigue/Sklearn_PyTorch
 - Test class shows how to use it:
 - https://github.com/ValentinFigue/Sklearn_PyTorch/blob/master/tests/random_forest_tests.py
 - https://github.com/ValentinFigue/Sklearn_PyTorch/blob/master/tests/binary_tree_tests.py
 - Use it to implement Random Forest & Decision Trees in PyTorch for 4FGL Catalog?

Update: 01/15/2024

Progress

- Completed Random Forest & Decision Tree implementations using PyTorch for 4FGL Catalog file
 - Random Forest
 - Highest sensitivity = 98.05749805749805
 - Decision Trees
 - Highest sensitivity = 98.13519813519814

Correctly, the sensitivity is more than that of LR, NN, DNN!

Background

- Referenced Random Forest & Decision Tree implementations using PyTorch
 - https://github.com/ValentinFigue/Sklearn_PyTorch
- Random Forest test class shows how to use it:
 - https://github.com/ValentinFigue/Sklearn_PyTorch/blob/master/tests/random_forest_tests.py
 - `random_forest = Sklearn_PyTorch.TorchRandomForestRegressor(nb_trees=10, nb_samples=2, max_depth=3)`
 - `random_forest.fit(train_features, train_labels)`
- Decision Tree test class shows how to use it:
 - https://github.com/ValentinFigue/Sklearn_PyTorch/blob/master/tests/binary_tree_tests.py
 - `binary_tree = Sklearn_PyTorch.TorchDecisionTreeClassifier(max_depth=1)`
 - `binary_tree.fit(train_features, train_labels)`

Code Details

- Method of creating classifier and invoking fit method:

Transforms dataset into
separate feature & labels
arrays (next slide)

4FGLReproduction_RF.py

```
# Krishiv Bhatia: Invoke TorchRandomForestClassifier
random_forest = TorchRandomForestClassifier( nb_trees: 200, nb_samples: 2500, max_depth: 15)
print("random forest = ", random_forest.nb_trees, random_forest.nb_samples, random_forest.max_depth)

# Krishiv Bhatia: split train dataset into features and labels
train_features, train_labels = dataset_to_features_labels(train_dataset)
random_forest.fit(torch.FloatTensor(train_features), torch.LongTensor(train_labels))
```

4FGLReproduction_decision_tree.py

```
# Krishiv Bhatia: Invoke TorchDecisionTreeClassifier
decision_tree = TorchDecisionTreeClassifier(20)
print("TorchDecisionTreeClassifier = ", decision_tree.max_depth)

# Krishiv Bhatia: split train dataset into features and labels
train_features, train_labels = dataset_to_features_labels(train_dataset)
decision_tree.fit(torch.FloatTensor(train_features), torch.LongTensor(train_labels))
```

Random Forest

Decision Trees

Transformations

- Transformed the tensor feature and labels array into regular arrays

```

Update: 01/22/2024

Progress

- Completed the problem of Energy Band Level Hardness ratios
- Column: Flux_Band
- Printed it out. Numpy array with 8 numbers
 - `source[flux_col] = [1.318705452994784e-12, 3.918336766162156e-10, 3.155801175935835e-10, 1.0454052207231612e-10, 2.0413597895396762e-11, 6.700519479541089e-12, 1.909341825270805e-12, 2.2682772056883754e-16]`

Transformation

- In FGL4Dataset.py
- Converted numpy array to list

- `flux_list = res = source[flux_col].tolist()`

- Calculated hardness ratios

```
# Calculate hardness ratios (also considered in the paper)
for index in range(1, len(flux_list)):
    unit.append((flux_list[index] - flux_list[index-1] + 0.0) /
                (flux_list[index] + flux_list[index-1] + 0.0))
xdata.append(unit)
```

Calculates
hardness ratios
from one band
index to next

Next Steps

- Could you kindly clarify what needs to be done with the following tasks
 - associated/unassociated sources
 - AGN types

Update: 02/09/2024

Progress

- Simplified Logistic Regression & Neural Networks Python code to train and then test on the entire 30% test dataset
- This resolves the earlier problem where the test was showing only PSR count = 10 & AGN count = 290
- New scripts:
 - LR: 4FGLReproductionBasicLRnew.py
 - NN: 4FGLNNnew.py
 - DNN: 4FGLDNNnew.py
 - Only difference in the above scripts is the model trained and tested

Training

```
torch.set_default_tensor_type(torch.DoubleTensor)
torch.manual_seed(82)
LogRegModel = LogisticRegression(train_dataset)
# Stochastic Gradient Descent. I could use Adams but Adams is worse than regular SGD unless you
optimizer = torch.optim.SGD(LogRegModel.parameters(), lr=0.0001)
print("optimizer = ", optimizer.__class__)
# Binary Cross Entropy Loss which is the loss method that would most likely be used in this scenario
criterion = nn.BCELoss()
tot_iter = 100
print("total iterations = ", tot_iter)
for iteration in range(0, tot_iter):
    dev_inputs = dev_labels = []
    print("Iteration # ", iteration)
    total_samples = len(train_dataset)
    # KrishivB: Put run_iteration code in utils.py, imported it, and call here
    for epoch in range(30):
        (dev_inputs, dev_labels) = run_iteration(LogRegModel, iteration, train_dataset, total_samples, criterion,
                                                optimizer, dev_inputs, dev_labels, append_dev_input_label: True)
```

Define model once

Iterations for loop

Train model in iterations

Testing

Enumerate over
test dataset

Predict

Get actual
value

Check if predicted
matches with actual

```
correct = correct_agm = correct_psr = total_agm = total_psr = 0
for i, (inputs, labels) in enumerate(test_dataset):
    y_predicted = LogRegModel(inputs) # Insert/fit Model for prediction here
    predicted_item = y_predicted.data.item()
    print(" i, y_predicted, y_predicted.data, predicted_item = ", i, y_predicted, y_predicted.data, predicted_item)
    predicted_val = 0 if (math.isnan(predicted_item)) else round(predicted_item)
    label_val = labels.item()
    total_agm += 1 if label_val == 1 else 0
    total_psr += 1 if label_val == 0 else 0
    match = (predicted_val == label_val)
    if match:
        correct += 1
        correct_agm += 1 if label_val == 1 else 0
        correct_psr += 1 if label_val == 0 else 0
    print("i, predicted_item, predicted_val, label_val, correct, match = ",
          i, predicted_item, predicted_val, label_val, correct, match)
```

 - agn sensitivity = 0.9935691318327974
 - psr sensitivity = 0.6744186046511628

Observations

- I found overall AGN sensitivity to be > 0.995 throughout but PSR sensitivity to be around 0.5.
- With the NN & DNN model, PSR sensitivity started going up with more training (as # iterations increased).
- In the case of NN with 150 iterations (each iteration having 30 epochs), PSR sensitivity increased to 0.65.
- In the case of DNN, with 25 iterations, PSR sensitivity increased to 0.60 and with 100 iterations, increased to 0.65, and increased to 0.67 with 150 iterations.
- So we may need to find what is the problem with PSR?
 - Is it related to the choice of model, features, or training?

Update: 02/19/2024

Progress

- Fix the problem of low Pulsar count
- Added “msp” in wantedtypes list

This!

```
|# KrishivB: Added AGN in caps  
|wantedtypes = ["PSR", "psr", "YNG", "yng", "MSP", "msp", "FSRQ", "fsrq", "BLL", "bll", "BCU", "bcu", "RDG", "rdg",  
|              "NLSY1", "nlsy1", "AGN", "agn", "ssrq", "sey"]
```

Progress

- Added “MSP”, “msp” to the **source[wanted_type_col]** check in FGL4Dataset.py
- It was missing. Only “PSR”, “psr” were present.

```
# Calculate hardness ratios (also considered in the paper)
for index in range(1, len(flux_list)):
    unit.append((flux_list[index] - flux_list[index-1] + 0.0) /
                (flux_list[index] + flux_list[index-1] + 0.0))
xdata.append(unit)
if source[wanted_type_col] in ("PSR", "psr", "MSP", "msp"):
    ydata.append([0]) # 0 is for pulsar
else:
    ydata.append([1]) # 1 is for AGN
```

This!

Update: 02/26/2024

Progress

- Classified unassociated sources as PSR or AGN
 - Initially, trained and tested models with regular dataset
 - Then, read dataset with field Class1 == null
 - Used trained model to predict whether the unassociated sources are PSRs or AGNs
- Also, plotted measure of outlyingness of the unassociated sources from the class.

Outlyingness Measure

- Predictions ranged from [0.0, 1.0]
- AGNs
 - Predictions were in range [0.5, 1.0]
 - The more near it was to 1.0, the closer it was to the class
 - The farther away it was from 1.0 (or closer to 0.5), the more outlying it was from the class
- PSRs
 - Predictions were in range [0.0, 0.5]
 - The more near it was 0.0, the closer it was to the class
 - The farther away it was from 0.0 (or closer to 0.5), the more outlying it was from the class

Code change

- New files

- Logistic Regression
 - 4FGL_LR_cls1_null.py
- Neural Networks
 - 4FGL_NN_cls1_null.py
 - 4FGL_DNN_cls1_null.py
- Random Forests
 - 4FGL_RF_cls1_null.py
- Utils
 - FGL4Dataset_cls1_null.py

Read dataset with field Class1 == null

- Updated files

- Random Forests
 - random_forest.py

```
11 11 11
predictions = []
for tree, index_features in zip(self.trees, self.trees_features):
    sampled_vector = torch.index_select(vector, dim=0, index=index_features)
    predictions.append(tree.predict(sampled_vector))
print("predictions=", predictions)
print("sum(predictions)={}, len(self.trees)={}, sum(predictions)/len(self.trees)={}",
      sum(predictions), len(self.trees), sum(predictions)/len(self.trees))
return sum(predictions)/len(self.trees)
# return max(set(predictions), key=predictions.count)
```

Returned mean instead of max
to get outlyingness measure

Code change

- FGL4Dataset_cls1_null.py

```
class FGL4Dataset_Cls1_Null(Dataset):
    # Krishiv Bhatia
    def __init__(self, wanted_type_col, flux_col, wanted_types, wanted_feature_names, poi
        # Create x/input data
        xdata = []
        ydata = []
        # Select sources that are a part of the wanted types
        for source in point_source_catalogue.data:
            # for feature_names in wanted_feature_names:
            #     print("{0} = {1}".format(feature_names, source[feature_names]))
            # print("(type(source[flux_col]) = ", type(source[flux_col]))
            flux_list = res = source[flux_col].tolist()
            # print("source[flux_col] = {0}".format(flux_list))
            print("source[wanted_type_col] = ", source[wanted_type_col])
            if source[wanted_type_col] == '':
                unit = []
                # Append wanted params. Applied a log transformation to paras with highly
                unit.append(float(source[wanted_feature_names[0]]))
                unit.append(float(source[wanted_feature_names[1]]))
                unit.append(float(source[wanted_feature_names[2]]))
                unit.append(float(source[wanted_feature_names[3]]))
```

Results

- LR:
 - Firmly predicted 1433-1465 AGNs in [0.95-1.0] range
 - Firmly predicted 58-65 PSRs in [0.0-0.05] range until 200 iterations.
- Neural Networks
 - Firmly predicted 1465-1543 AGNs [0.95-1.0] range
 - Firmly predicted 47-119 PSRs [0.0-0.05] range
- Deep Neural Networks
 - Firmly predicted 1464-1927 AGNs [0.95-1.0] range
 - Firmly predicted 37-254 PSRs [0.0-0.05] range
 - More iterations predicted more AGNs in [0.95-1.0] range and more PSRs in [0.0-0.05] range
- Random Forests
 - Firmly predicted 927-992 AGNs [0.95-1.0] range
 - Firmly predicted 0 PSRs in the [0.0-0.05] range
 - Predicted 0-4 PSRs in the [0.5-0.10] range
 - Weakly predicted 45-65 PSRs in [0.45-0.5] range

Update: 03/22/2024

Progress

- Solved the **unbalanced dataset problem** by multiplying total count of Pulsar rows
- So to multiply by 10, created 9 more rows for each Pular row

Code Changes

```
unit.append(float(source[wanted_feature_names[9]]))
unit.append(float(source[wanted_feature_names[10]]))
unit.append(float(source[wanted_feature_names[11]]))
unit.append(float(source[wanted_feature_names[12]]))
# Calculate hardness ratios (also considered in the paper)
for index in range(1, len(flux_list)):
    unit.append((flux_list[index] - flux_list[index-1] + 0.0) /
                (flux_list[index] + flux_list[index-1] + 0.0))
xdata.append(unit)
if source[wanted_type_col] in ("PSR", "psr", "MSP", "msp"):
    ydata.append([0]) # 0 is for pulsar
else:
    ydata.append([1]) # 1 is for AGN
# Multiply Pulsar rows by 10. Create 9 more rows for each Pulsar row
if source[wanted_type_col] in ("PSR", "psr", "MSP", "msp"):
    for i in range(9):
        xdata.append(unit)
        ydata.append([0]) # 0 is for pulsar
self.x = torch.from_numpy(np.array(xdata, float))
self.y = torch.from_numpy(np.array(ydata, float))
self.size = len(xdata)
```

Multiply Pulsar rows
by creating 9 more
rows for each Pulsar
row to get 10x rows

Code Changes

- Create **3 more PSR rows** for each PSR row

```
correct = 1527
test_size = 1587
correct_agm = 1170
total_agm = 1187 ←
correct_psr = 357
total_psr = 400 ←
sensitivity = 96.21928166351607
agm_sensitivity = 98.56781802864364
psr_sensitivity = 89.25
```

Code Changes

- #trees: 20, # samples: 500, depth: 15

Now PSRs have
been strongly
identified

2077 unassociated sources AGN classification

Classification-RF-20-500-15

353 unassociated sources PSR classification

Classification-RF-20-500-15

Code Changes

- Create **4 more PSR rows** for each PSR row

```
correct = 1649
test_size = 1683
correct_agm = 1171
total_agm = 1190 ←
correct_psr = 478
total_psr = 493 ←
sensitivity = 97.97979797979798
agm_sensitivity = 98.40336134453781
psr_sensitivity = 96.95740365111561
```

Code Changes

- #trees: 20, # samples: 500, depth: 15

Now PSRs have
been strongly
identified

1957 unassociated sources AGN classification

473 unassociated sources PSR classification

Code Changes

- Create **9 more PSR rows** for each PSR row

```
correct = 2112
test_size = 2163

Progress

- Created reporting script:
 - /Python/Reporting/4FGL_Reporting.py
 - /Python/Utils/FGL4Dataset_Reporting.py
- This enabled numbers to be reported from the different catalogs

Progress

4FGL_Reporting.py

```

BSL Catalog

BSL Catalog

Update: 07/12/2024

Today, I will discuss:

- Progress Summary
- Reading & Processing BSL, 1FGL, 2FGL, 3FGL datasets
- Joining datasets w/ Pandas merge
- Sumamaring results

Progress Summary

- Joined BSL, 1FGL, 2FGL, & 3FGL datasets to get insights on changes since BSL
- Codes:
 - **Reporting/4FGL_Join_Report.py**
 - Reads datasets
 - Calls 4FGL_Dataset_Processing to get columns
 - Joins datasets using Pandas merge
 - **Utils/4FGL_Dataset_Processing.py**
 - Extracts needed columns from the dataset like catalog number, Class1, 0FGL name, 1FGL name, 2FGL name

Read & Process BSL dataset

- Read BSL dataset

```
# Read BSL file
path = os.path.join(os.getcwd(), "../../FITS/gll_psc3month_BSL_v2.fit")
mainfile = fits.open(path)
point_source_catalogue = mainfile[1]
columns = 0
keymap = {}
mapkey = {}
for key in list(point_source_catalogue.header.keys()):
    if "TTYPE" in key:
        keymap[int(key[5:len(key))]-1] = point_source_catalogue.header[key]
        mapkey[point_source_catalogue.header[key]] = int(key[5:len(key))]-1
        # print(columns, key, point_source_catalogue.header[key])
        columns += 1
keymap = OrderedDict(sorted(keymap.items()))
mapkey = OrderedDict(sorted(mapkey.items()))
```

path

Read using astropy.io.fits library

- Convert to Pandas dataframe

```
# Get BSL dataset
wanted_type_col = 17 # class1
dataset = FGL4Dataset_Process(point_source_catalogue, wanted_type_col, other_cols: [])
bsl_list = dataset.get_all_list()
# Convert into dataframe
bsl_df = pd.DataFrame(bsl_list, columns=["BSL", "CLASS1-BSL"])
# Save into csv
bsl_df.to_csv('../../CSV/bsl_df.csv')
```

Call processing method which returns list

Get Class1 column

Convert list to dataframe

Output dataframe to csv

Process Dataset Method

4 usages ⤴ Krishiv Bhatia *

```
class FGL4Dataset_Process(Dataset):  
    all_list = []
```

⤴ Krishiv Bhatia *

```
def __init__(self, point_source_catalogue, wanted_type_col, other_cols):  
    self.all_list = []  
    for source in point_source_catalogue.data:  
        # source[0] is the catalog name & number like 0FGL J1413.1-6203  
        # source[0].split(' ')[1] gives J1413.1-6203  
        # add catalog number & class1 to lst  
        lst = [source[0].split(' ')[1]]  
        lst.append(source[wanted_type_col])  
        # now add other columns if they are present  
        for col in other_cols:  
            if source[col] is not None and source[col] != '':  
                lst.append(source[col].split()[1])  
            else:  
                lst.append('')  
        self.all_list.append(lst)
```

- Process the dataset read to return required columns as list

Add catalog number
& Class1 to list

Add other columns
passed via method
parameters to list

3 usages ⤴ Krishiv Bhatia

```
def get_all_list(self):  
    return self.all_list
```

Read & Process 1FGL dataset

- Read 1FGL dataset

```
path = os.path.join(os.getcwd(), "../../FITS/gll_psc_v03_1FGL.fits")
mainfile = fits.open(path)
point_source_catalogue = mainfile[1]
columns = 0
keymap = {}
mapkey = {}
for key in list(point_source_catalogue.header.keys()):
    if "TTYPE" in key:
        keymap[int(key[5:len(key))]-1] = point_source_catalogue.header[key]
        mapkey[point_source_catalogue.header[key]] = int(key[5:len(key))]-1
        # print(columns, key, point_source_catalogue.header[key])
        columns += 1
```

Read using
astropy.io.fits library

- Convert into Pandas dataframe

```
# col 49 is 0FGL_Name: 78 TTYPE1 0FGL_Name
wanted_type_col = 54 # Class1
dataset = FGL4Dataset_Process(point_source_catalogue, wanted_type_col, other_cols=[49])
fgl1_lst = dataset.get_all_list()
fgl1_df = pd.DataFrame(fgl1_lst, columns=["1FGL", "CLASS1-1FGL", "1FGL-BSL"])
fgl1_df.to_csv('../../CSV/fgl1_df.csv')
```

Call processing
method which
returns list

Get Class1 & 0FGL
name columns

Convert list
to dataframe

Output
dataframe to csv

Read & Process 2FGL dataset

- Read 2FGL dataset

```
columns = 0
keymap = {}
mapkey = {}
path = os.path.join(os.getcwd(), '../FITS/gll_psc_v09_2FGL.fit')
mainfile = fits.open(path)
point_source_catalogue = mainfile[1]
for key in list(point_source_catalogue.header.keys()):
    if "TTYPE" in key:
        keymap[int(key[5:len(key)])-1] = point_source_catalogue.header[key]
        mapkey[point_source_catalogue.header[key]] = int(key[5:len(key)])-1
        # print(columns, key, point_source_catalogue.header[key])
        columns += 1
```

Read using
astropy.io.fits library

- Convert into Pandas dataframe

Call processing
method which
returns list

Get Class1, 0FGL,
& 1FGL name
columns

```
# 145 TTYPE57 0FGL_Name, 146 TTYPE58 1FGL_Name
wanted_type_col = 63 # class1
dataset = FGL4Dataset_Process(point_source_catalogue, wanted_type_col, other_cols=[56,57])
fgl2_lst = dataset.get_all_list()
fgl2_df = pd.DataFrame(fgl2_lst, columns=["2FGL", "CLASS1-2FGL", "2FGL-BSL", "2FGL-1FGL"])
fgl2_df.to_csv('../CSV/fgl2_df.csv')
```

Output
dataframe to csv

Convert list
to dataframe

Join BSL, 1FGL, & 2FGL datasets

Join BSL and 1FGL
datasets using
pandas.merge

Left join on BSL column.
This will capture all rows
from BSL dataset but only
matching rows from 1FGL.

```
print("=====Merge-BSL-1FGL=====")
joined_BSL_1FGL = pd.merge(bsl_df, fgl1_df, left_on='BSL', right_on='1FGL-BSL', how='left')
joined_BSL_1FGL.to_csv('../..CSV/joined_BSL_1FGL.csv')
joined_BSL_1FGL_None_CLS1BSL = joined_BSL_1FGL[joined_BSL_1FGL["CLASS1-BSL"]=='']
joined_BSL_1FGL_None_CLS1BSL.to_csv('../..CSV/joined_BSL_1FGL_NoneCLS1_BSL.csv')

print("=====Merge BSL, 1FGL, 2FGL=====")
joined_BSL_1FGL_2FGL = pd.merge(joined_BSL_1FGL, fgl2_df, left_on='BSL', right_on='2FGL-BSL', how='left')
joined_BSL_1FGL_2FGL.to_csv('../..CSV/joined_BSL_1FGL_2FGL.csv')
joined_BSL_1FGL_2FGL_None_CLS1_BSL = joined_BSL_1FGL_2FGL[joined_BSL_1FGL_2FGL["CLASS1-BSL"]=='']
joined_BSL_1FGL_2FGL_None_CLS1_BSL.to_csv('../..CSV/joined_BSL_1FGL_2FGL_NoneCLS1_BSL.csv')
```

Join BSL, 1FGL
combined dataset
with 2FGL using
pandas.merge

Left join on BSL column.
This will capture all rows
from BSL dataset but only
matching rows from 2FGL.

```

Read using
astropy.io.fits library

- Convert into Pandas dataframe

```
# TTYPE65 0FGL_Name, TTYPE66 1FGL_Name, TTYPE67 2FGL_Name
wanted_type_col = 73 # class1
dataset = FGL4Dataset_Process(point_source_catalogue, wanted_type_col, other_cols: [64,65,66])
fgl3_lst = dataset.get_all_list()
fgl3_df = pd.DataFrame(fgl3_lst, columns = ["3FGL", "CLASS1-3FGL", "3FGL-BSL", "3FGL-1FGL",
                                           "3FGL-2FGL"])
fgl3_df.to_csv('../CSV/fgl3_df.csv')
```

Call processing
method which
returns list

Get Class1, 0FGL,
1FGL, & 2FGL
name columns

Convert list
to dataframe

Output
dataframe to csv

Join BSL, 1FGL, & 2FGL with 3FGL datasets

Join BSL and 1FGL
datasets using
pandas.merge

Left join on BSL column.
This will capture all rows
from BSL dataset but only
matching rows from 1FGL.

```
print("=====Merge BSL, 1FGL, 2FGL, with 3FGL=====")
joined_BSL_1FGL_2FGL_3FGL = pd.merge(joined_BSL_1FGL_2FGL, fgl3_df, left_on='BSL',
                                     right_on='3FGL-BSL', how='left')
joined_BSL_1FGL_2FGL_3FGL.to_csv('../CSV/joined_BSL_1FGL_2FGL_3FGL.csv')
joined_BSL_1FGL_2FGL_3FGL_NONE_CLS1_BSL = joined_BSL_1FGL_2FGL_3FGL[joined_BSL_1FGL_2FGL_3FGL["CLASS1-BSL"]=='']
joined_BSL_1FGL_2FGL_3FGL_NONE_CLS1_BSL.to_csv('../CSV/joined_BSL_1FGL_2FGL_3FGL_NONE_CLS1_BSL.csv')
```
